Figure A1: **Selection of the tree cover threshold to define the land type for unclassified areas in 2000.** We considered the forest in 2000 (Harper *et al.*, 2007) in the moist ecoregion (see Fig. 1). We plotted the percentage of forest having a tree cover greater or equal to a given value specified by the x-axis. From this figure, we see that 90% of the moist forest in 2000 has a tree cover ≥ 75 .
